INHIBITORS OF ASPARTYL PROTEASE

TECHNICAL FIELD OF THE INVENTION

The present invention relates to a novel class of sulfonamides which are aspartyl protease inhibitors. In  
5 one embodiment, this invention relates to a novel class of HIV aspartyl protease inhibitors characterized by specific structural and physicochemical features. This invention also relates to pharmaceutical compositions comprising these compounds. The compounds and  
10 pharmaceutical compositions of this invention are particularly well suited for inhibiting HIV-1 and HIV-2 protease activity and consequently, may be advantageously used as anti-viral agents against the HIV-1 and HIV-2 viruses. This invention also relates to methods for  
15 inhibiting the activity of HIV aspartyl protease using the compounds of this invention and methods for screening compounds for anti-HIV activity.

BACKGROUND OF THE INVENTION

The human immunodeficiency virus ("HIV") is the  
20 causative agent for acquired immunodeficiency syndrome ("AIDS") -- a disease characterized by the destruction of the immune system, particularly of CD4<sup>+</sup> T-cells, with attendant susceptibility to opportunistic infections -- and its precursor AIDS-related complex ("ARC") -- a  
25 syndrome characterized by symptoms such as persistent generalized lymphadenopathy, fever and weight loss.

As in the case of several other retroviruses, HIV encodes the production of a protease which carries

out post-translational cleavage of precursor polypeptides in a process necessary for the formation of infectious virions (S. Crawford et al., "A Deletion Mutation in the 5' Part of the pol Gene of Moloney Murine Leukemia Virus Blocks Proteolytic Processing of the gag and pol Polyproteins", J. Virol., 53, p. 899 (1985)). These gene products include pol, which encodes the virion RNA-dependent DNA polymerase (reverse transcriptase), an endonuclease, HIV protease, and gag, which encodes the core-proteins of the virion (H. Toh et al., "Close Structural Resemblance Between Putative Polymerase of a Drosophila Transposable Genetic Element 17.6 and pol gene product of Moloney Murine Leukemia Virus", EMBO J., 4, p. 1267 (1985); L.H. Pearl et al., "A Structural Model for the Retroviral Proteases", Nature, pp. 329-351 (1987); M.D. Power et al., "Nucleotide Sequence of SRV-1, a Type D Simian Acquired Immune Deficiency Syndrome Retrovirus", Science, 231, p. 1567 (1986)).

A number of synthetic anti-viral agents have been designed to target various stages in the replication cycle of HIV. These agents include compounds which block viral binding to CD4<sup>+</sup> T-lymphocytes (for example, soluble CD4), and compounds which interfere with viral replication by inhibiting viral reverse transcriptase (for example, didanosine and zidovudine (AZT)) and inhibit integration of viral DNA into cellular DNA (M.S. Hirsh and R.T. D'Aquila, "Therapy for Human Immunodeficiency Virus Infection", N.Eng.J.Med., 328, p. 1686 (1993)). However, such agents, which are directed primarily to early stages of viral replication, do not prevent the production of infectious virions in chronically infected cells. Furthermore, administration

of some of these agents in effective amounts has led to cell-toxicity and unwanted side effects, such as anemia and bone marrow suppression.

More recently, the focus of anti-viral drug  
5 design has been to create compounds which inhibit the formation of infectious virions by interfering with the processing of viral polyprotein precursors. Processing of these precursor proteins requires the action of virus-  
10 encoded proteases which are essential for replication (Kohl, N.E. et al. "Active HIV Protease is Required for Viral Infectivity" Proc. Natl. Acad. Sci. USA, 85, p. 4686 (1988)). The anti-viral potential of HIV  
15 protease inhibition has been demonstrated using peptidyl inhibitors. Such peptidyl compounds, however, are typically large and complex molecules that tend to  
20 exhibit poor bioavailability and are not generally consistent with oral administration. Accordingly, the need still exists for compounds that can effectively inhibit the action of viral proteases, for use as agents  
for preventing and treating chronic and acute viral infections.

#### SUMMARY OF THE INVENTION

The present invention provides a novel class of compounds, and pharmaceutically acceptable derivatives  
25 thereof, that are useful as inhibitors of aspartyl proteases, in particular, HIV aspartyl protease. These compounds can be used alone or in combination with other therapeutic or prophylactic agents, such as anti-virals, antibiotics, immunomodulators or vaccines, for the  
30 treatment or prophylaxis of viral infection.

According to a preferred embodiment, the compounds of this invention are capable of inhibiting HIV

viral replication in human CD<sub>4</sub><sup>+</sup> T-cells. These compounds are useful as therapeutic and prophylactic agents to treat or prevent infection by HIV-1 and related viruses which may result in asymptomatic infection, AIDS-related complex ("ARC"), acquired immunodeficiency syndrome ("AIDS"), or similar disease of the immune system.

Unless expressly stated to the contrary, the terms "-SO<sub>2</sub>-" and "-S(O)<sub>2</sub>-" as used herein refer to a  
10 sulfone or sulfone derivative (i.e., both appended groups linked to the S), and not a sulfinic ester.

For the compounds of formula I, and intermediates thereof, the stereochemistry of OR<sup>7</sup> is defined relative to D on the adjacent carbon atom, when  
15 the molecule is drawn in an extended zigzag representation (such as that drawn for compound of formula I). If both OR<sup>7</sup> and D reside on the same side of the plane defined by the extended backbone of the compound, the stereochemistry of OR<sup>7</sup> will be referred to  
20 as "syn". If OR<sup>7</sup> and D reside on opposite sides of that plane, the stereochemistry of OR<sup>7</sup> will be referred to as "anti".

The term "alkyl", alone or in combination with any other term, refers to a straight-chain or branch-  
25 chain saturated aliphatic hydrocarbon radical containing the specified number of carbon atoms, or where no number is specified, preferably from 1 to about 15 and more preferably from 1 to about 10 carbon atoms. Examples of alkyl radicals include, but are not limited to, methyl,

infection, for example an HIV infection, in a patient  
either as monotherapy or in combination with other  
agents. The term "treating" as used herein refers to the  
alleviation of symptoms of a particular disorder in a  
10 patient or the improvement of an ascertainable  
measurement associated with a particular disorder. The  
term "prophylactically effective amount" refers to an  
amount effective in preventing a virus infection, for  
example an HIV infection, in a patient. As used herein,  
15 the term "patient" refers to a mammal, including a human.

20 invention, these terms refer to the human  
immunodeficiency virus type 1 aspartyl protease.

The term "thiocarbamates" refers to compounds

It will be understood by those of skill in the art that component M or M' in the formulae set forth herein will have either a covalent, a covalent/ zwitterionic, or an ionic association with either Z or R<sup>9</sup> depending upon the actual choice for M or M'. When M or M' is hydrogen, alkyl, alkenyl, or R<sup>6</sup>, M or M' is covalently bound to R<sup>9</sup> or Z. If M is a mono- or bivalent metal or other charged species (i.e., NH<sub>4</sub><sup>+</sup>), there is an ionic interaction between M and Z and the resulting compound is a salt.

When x is 0 in (M)<sub>x</sub>, Z may be a charged species. When that occurs, the other M may be oppositely charged to produce a 0 net charge on the molecule. Alternatively, the counter ion may be located elsewhere in the molecule.

5 heterocyclic ring is optionally substituted with one to  
two groups independently selected from  $-CH_3$ , R<sup>4</sup>, or Ht.

Another preferred embodiment of compounds of  
formula II are those wherein:

E is a 5-membered heterocyclic ring containing one S

with one to two groups independently selected from  $-CH_3$ ,  
R<sup>4</sup>, or Ht.

More preferred are compounds of formula II set  
15 forth above, wherein R<sup>7</sup> in  $-OR^7$  is  $-PO(OM)_2$  or  
 $C(O)CH_2OCH_2CH_2OCH_2CH_2OCH_3$  and both R<sup>7</sup> in  $-N(R^7)_2$  are H,  
wherein M is H, Li, Na, K or C<sub>1</sub>-C<sub>4</sub> alkyl; or wherein R<sup>7</sup> in  
 $-OR^7$  is  $C(O)CH_2OCH_2CH_2OCH_3$ , one R<sup>7</sup> in  $-N(R^7)_2$  is  
 $C(O)CH_2OCH_2CH_2OCH_3$  and the other is H.

20 The compounds according to the invention  
contain one or more asymmetric carbon atoms and thus  
occur as racemates and racemic mixtures, single  
enantiomers, diastereomeric mixtures and individual  
diastereomers. All such isomeric forms of these  
25 compounds are expressly included in the present  
invention. Each stereogenic carbon may be of the R or S  
configuration. Although the specific compounds  
exemplified in this application may be depicted in a  
particular stereochemical configuration, compounds having  
30 either the opposite stereochemistry at any given chiral  
center or mixtures thereof are also envisioned.

Specific preferred compounds of the present invention are set forth below in Table 1.

The compounds of the present invention can be readily prepared by techniques known in the art. Scheme I illustrates a general synthetic route to compounds of formula (I).

15

SCHEME I

In Step 1 of Scheme I, radical R' is selected such that R'-CH<sub>2</sub>- is D'.

- 5 The synthetic approach illustrated in Scheme I can be readily extended to produce other compounds of the present invention. The above synthetic scheme is not intended to comprise a comprehensive list of all means by which compounds described and claimed in this application

may be synthesized. Further methods will be evident to those of ordinary skill in the art.

As discussed above, the novel compounds of the present invention are excellent ligands for aspartyl proteases, particularly HIV-1 and HIV-2 proteases. Accordingly, these compounds are capable of targeting and inhibiting late stage events in HIV replication, i.e., the processing of the viral polyproteins by HIV encoded proteases. Such compounds inhibit the proteolytic processing of viral polyprotein precursors by inhibiting aspartyl protease. Because aspartyl protease is essential for the production of mature virions, inhibition of that processing effectively blocks the spread of virus by inhibiting the production of infectious virions, particularly from chronically infected cells. Compounds according to this invention advantageously inhibit the ability of the HIV-1 virus to infect immortalized human T cells over a period of days, as determined by an assay of extracellular p24 antigen -- a specific marker of viral replication. Other anti-viral assays have confirmed the potency of these compounds.

The compounds of this invention may be employed in a conventional manner for the treatment of viruses, such as HIV and HTLV, which depend on aspartyl proteases for obligatory events in their life cycle. Such methods of treatment, their dosage levels and requirements may be selected by those of ordinary skill in the art from available methods and techniques. For example, a compound of this invention may be combined with a pharmaceutically acceptable adjuvant for administration to a virally-infected patient in a

pharmaceutically acceptable manner and in an amount effective to lessen the severity of the viral infection.

Alternatively, the compounds of this invention may be used in vaccines and methods for  
5 protecting individuals against viral infection over an extended period of time. The compounds may be employed in such vaccines either alone or together with other compounds of this invention in a manner consistent with the conventional utilization of protease inhibitors in  
10 vaccines. For example, a compound of this invention may be combined with pharmaceutically acceptable adjuvants conventionally employed in vaccines and administered in prophylactically effective amounts to protect individuals over an extended period time against HIV infection. As  
15 such, the novel protease inhibitors of this invention can be administered as agents for treating or preventing HIV infection in a mammal.

The compounds of formula I, especially those having a molecular weight of less than about 700 g/mole,  
20 may be readily absorbed by the bloodstream of mammals upon oral administration. Compounds of formula I having a molecular weight of less than about 600 g/mole are most likely to demonstrate oral availability. This surprisingly impressive oral availability makes such  
25 compounds excellent agents for orally-administered treatment and prevention regimens against HIV infection.

The compounds of this invention may be administered to a healthy or HIV-infected patient either as a single agent or in combination with other anti-viral  
30 agents which interfere with the replication cycle of HIV. By administering the compounds of this invention with other anti-viral agents which target different events in

the viral life cycle, the therapeutic effect of these compounds is potentiated. For instance, the co-administered anti-viral agent can be one which targets early events in the life cycle of the virus, such as cell entry, reverse transcription and viral DNA integration into cellular DNA. Anti-HIV agents targeting such early life cycle events include, didanosine (ddI), alcitabine (ddC), d4T, zidovudine (AZT), polysulfated polysaccharides, sT4 (soluble CD4), ganiclovir, dideoxycytidine, trisodium phosphonoformate, eflornithine, ribavirin, acyclovir, alpha interferon and trimenotrexate. Additionally, non-nucleoside inhibitors of reverse transcriptase, such as TIBO or nevirapine, may be used to potentiate the effect of the compounds of this invention, as may viral uncoating inhibitors, inhibitors of trans-activating proteins such as tat or rev, or inhibitors of the viral integrase.

Combination therapies according to this invention exert a synergistic effect in inhibiting HIV replication because each component agent of the combination acts on a different site of HIV replication. The use of such combinations also advantageously reduces the dosage of a given conventional anti-retroviral agent which would be required for a desired therapeutic or prophylactic effect as compared to when that agent is administered as a monotherapy. These combinations may reduce or eliminate the side effects of conventional single anti-retroviral agent therapies while not interfering with the anti-retroviral activity of those agents. These combinations reduce potential of resistance to single agent therapies, while minimizing any associated toxicity. These combinations may also

increase the efficacy of the conventional agent without increasing the associated toxicity. In particular, we have discovered that these compounds act synergistically in preventing the replication of HIV in human T cells.

- 5 Preferred combination therapies include the administration of a compound of this invention with AZT, ddI, ddC or d4T.

Alternatively, the compounds of this invention may also be co-administered with other HIV  
10 protease inhibitors such as Ro 31-8959 (Roche), L-735,524 (Merck), XM 323 (Du-Pont Merck) and A-80,987 (Abbott) to increase the effect of therapy or prophylaxis against various viral mutants or members of other HIV quasi species.

- 15 We prefer administering the compounds of this invention as single agents or in combination with retroviral reverse transcriptase inhibitors, such as derivatives of AZT, or other HIV aspartyl protease inhibitors. We believe that the co-administration of the  
20 compounds of this invention with retroviral reverse transcriptase inhibitors or HIV aspartyl protease inhibitors may exert a substantial synergistic effect, thereby preventing, substantially reducing, or completely eliminating viral infectivity and its associated  
25 symptoms.

The compounds of this invention can also be administered in combination with immunomodulators (e.g., bropirimine, anti-human alpha interferon antibody, IL-2, GM-CSF, methionine enkephalin, interferon alpha,  
30 diethyldithiocarbamate, tumor necrosis factor, naltrexone and rEPO); and antibiotics (e.g., pentamidine

isethiorate) to prevent or combat infection and disease associated with HIV infections, such as AIDS and ARC.

When the compounds of this invention are administered in combination therapies with other agents, they may be administered sequentially or concurrently to the patient. Alternatively, pharmaceutical or prophylactic compositions according to this invention may be comprised of a combination of an aspartyl protease inhibitor of this invention and another therapeutic or prophylactic agent.

Although this invention focuses on the use of the compounds disclosed herein for preventing and treating HIV infection, the compounds of this invention can also be used as inhibitory agents for other viruses which depend on similar aspartyl proteases for obligatory events in their life cycle. These viruses include, as well as other AIDS-like diseases caused by retroviruses, such as simian immunodeficiency viruses, but are not limited to, HTLV-I and HTLV-II. In addition, the compounds of this invention may also be used to inhibit other aspartyl proteases, and in particular, other human aspartyl proteases, including renin and aspartyl proteases that process endothelin precursors. Pharmaceutical compositions of this invention comprise any of the compounds of the present invention, and pharmaceutically acceptable salts thereof, with any pharmaceutically acceptable carrier, adjuvant or vehicle. Pharmaceutically acceptable carriers, adjuvants and vehicles that may be used in the pharmaceutical compositions of this invention include, but are not limited to, ion exchangers, alumina, aluminum stearate, lecithin, serum proteins, such as human serum albumin,

buffer substances such as phosphates, glycine, sorbic acid, potassium sorbate, partial glyceride mixtures of saturated vegetable fatty acids, water, salts or electrolytes, such as protamine sulfate, disodium  
5 hydrogen phosphate, potassium hydrogen phosphate, sodium chloride, zinc salts, colloidal silica, magnesium trisilicate, polyvinyl pyrrolidone, cellulose-based substances, polyethylene glycol, sodium  
carboxymethylcellulose, polyacrylates, waxes,  
10 polyethylene-polyoxypropylene-block polymers, polyethylene glycol and wool fat.

The pharmaceutical compositions of this invention may be administered orally, parenterally, by inhalation spray, topically, rectally, nasally, buccally,  
15 vaginally or via an implanted reservoir. We prefer oral administration or administration by injection. The pharmaceutical compositions of this invention may contain any conventional non-toxic pharmaceutically-acceptable carriers, adjuvants or vehicles. The term parenteral as  
20 used herein includes subcutaneous, intracutaneous, intravenous, intramuscular, intra-articular, intrasynovial, intrasternal, intrathecal, intralesional and intracranial injection or infusion techniques.

The pharmaceutical compositions may be in the  
25 form of a sterile injectable preparation, for example, as a sterile injectable aqueous or oleaginous suspension. This suspension may be formulated according to techniques known in the art using suitable dispersing or wetting agents (such as, for example, Tween 80) and suspending  
30 agents. The sterile injectable preparation may also be a sterile injectable solution or suspension in a non-toxic parenterally-acceptable diluent or solvent, for example,

as a solution in 1,3-butanediol. Among the acceptable vehicles and solvents that may be employed are mannitol, water, Ringer's solution and isotonic sodium chloride solution. In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. For this purpose, any bland fixed oil may be employed including synthetic mono- or diglycerides. Fatty acids, such as oleic acid and its glyceride derivatives are useful in the preparation of injectables, as are natural pharmaceutically-acceptable oils, such as olive oil or castor oil, especially in their polyoxyethylated versions. These oil solutions or suspensions may also contain a long-chain alcohol diluent or dispersant such as Ph. Helv or a similar alcohol.

The pharmaceutical compositions of this invention may be orally administered in any orally acceptable dosage form including, but not limited to, capsules, tablets, and aqueous suspensions and solutions. In the case of tablets for oral use, carriers which are commonly used include lactose and corn starch. Lubricating agents, such as magnesium stearate, are also typically added. For oral administration in a capsule form, useful diluents include lactose and dried corn starch. When aqueous suspensions are administered orally, the active ingredient is combined with emulsifying and suspending agents. If desired, certain sweetening and/or flavoring and/or coloring agents may be added.

The pharmaceutical compositions of this invention may also be administered in the form of suppositories for rectal administration. These compositions can be prepared by mixing a compound of this

invention with a suitable non-irritating excipient which is solid at room temperature but liquid at the rectal temperature and therefore will melt in the rectum to release the active components. Such materials include, but are not limited to, cocoa butter, beeswax and polyethylene glycols.

Topical administration of the pharmaceutical compositions of this invention is especially useful when the desired treatment involves areas or organs readily accessible by topical application. For application topically to the skin, the pharmaceutical composition should be formulated with a suitable ointment containing the active components suspended or dissolved in a carrier. Carriers for topical administration of the compounds of this invention include, but are not limited to, mineral oil, liquid petroleum, white petroleum, propylene glycol, polyoxyethylene polyoxypropylene compound, emulsifying wax and water. Alternatively, the pharmaceutical composition can be formulated with a suitable lotion or cream containing the active compound suspended or dissolved in a carrier. Suitable carriers include, but are not limited to, mineral oil, sorbitan monostearate, polysorbate 60, cetyl esters wax, cetearyl alcohol, 2-octyldodecanol, benzyl alcohol and water. The pharmaceutical compositions of this invention may also be topically applied to the lower intestinal tract by rectal suppository formulation or in a suitable enema formulation. Topically-transdermal patches are also included in this invention.

The pharmaceutical compositions of this invention may be administered by nasal aerosol or inhalation. Such compositions are prepared according to

techniques well-known in the art of pharmaceutical formulation and may be prepared as solutions in saline, employing benzyl alcohol or other suitable preservatives, absorption promoters to enhance bioavailability,  
5 fluorocarbons, and/or other solubilizing or dispersing agents known in the art.

Dosage levels of between about 0.01 and about 100 mg/kg body weight per day, preferably between about 0.5 and about 50 mg/kg body weight per day of the active  
10 ingredient compound are useful in the prevention and treatment of viral infection, including HIV infection. Typically, the pharmaceutical compositions of this invention will be administered from about 1 to about 5 times per day or alternatively, as a continuous infusion.  
15 Such administration can be used as a chronic or acute therapy. The amount of active ingredient that may be combined with the carrier materials to produce a single dosage form will vary depending upon the host treated and the particular mode of administration. A typical  
20 preparation will contain from about 5% to about 95% active compound (w/w). Preferably, such preparations contain from about 20% to about 80% active compound.

Upon improvement of a patient's condition, a maintenance dose of a compound, composition or  
25 combination of this invention may be administered, if necessary. Subsequently, the dosage or frequency of administration, or both, may be reduced, as a function of the symptoms, to a level at which the improved condition is retained when the symptoms have been alleviated to the  
30 desired level, treatment should cease. Patients may, however, require intermittent treatment on a long-term basis upon any recurrence of disease symptoms.

As the skilled artisan will appreciate, lower or higher doses than those recited above may be required. Specific dosage and treatment regimens for any particular patient will depend upon a variety of factors, including  
5 the activity of the specific compound employed, the age, body weight, general health status, sex, diet, time of administration, rate of excretion, drug combination, the severity and course of the infection, the patient's disposition to the infection and the judgment of the  
10 treating physician.

The compounds of this invention are also useful as commercial reagents which effectively bind to aspartyl proteases, particularly HIV aspartyl protease. As commercial reagents, the compounds of this invention,  
15 and their derivatives, may be used to block proteolysis of a target peptide or may be derivatized to bind to a stable resin as a tethered substrate for affinity chromatography applications. These and other uses which characterize commercial aspartyl protease inhibitors will  
20 be evident to those of ordinary skill in the art.

"pharmaceutically acceptable derivative" or  
25 "pharmaceutically acceptable prodrug" means any pharmaceutically acceptable salt, ester, salt of an ester, or other derivative of a compound of this invention which, upon administration to a recipient, is capable of providing (directly or indirectly) a compound

compounds of this invention when such compounds are administered to a mammal (e.g., by allowing an orally administered compound to be more readily absorbed into the blood) or which enhance delivery of the parent  
5 compound to a biological compartment (e.g., the brain or lymphatic system) relative to the parent species.

A small amount of solid precipitated at this point. The mixture was treated with 10.2 mL (71.3 mmol) of benzyl chloroformate by slow addition over 5 minutes and then allowed to warm to RT. A clear solution resulted which was stirred at RT. After 18 hours the solution was concentrated *in vacuo*. The residue was suspended (would not dissolve) in CH<sub>2</sub>Cl<sub>2</sub> and the mixture was shaken with 10% aqueous citric acid in a separatory funnel. The aqueous suspension was separated, filtered to remove solid and the aqueous filtrate discarded. The solid was combined with the CH<sub>2</sub>Cl<sub>2</sub> suspension and the mixture concentrated to dryness at reduced pressure. The resulting residue was recrystallized from EtOH/water to afford 24.1 g (81%) of the desired compound at a white crystalline solid. NMR (DMSO-*d*<sub>6</sub>): 7.43-7.03 (m, 11H), 6.63 (d, 1H), 5.04 (s, 2H), 4.99 (d, 1H), 3.61-3.40 (m, 2H), 3.30 (m, 1H), 3.06-2.84 (m, 2H), 2.52 (m, 1H), 1.27 (s, 9H). MS(ESI): 437 (M+Na).

Examples (Compounds 299-372)

20 *General procedure for reactions of primary amine scaffolds with various electrophiles:*

A solution of the primary amine (0.02 M) in anhydrous THF at 0°C was treated with 1.05 equiv. of *N,N*-diisopropylethylamine (omitted for reactions with

isocyanates, examples 301, 306, and 312) followed by 1.05 equiv. of the appropriate electrophile (chloroformate, sulfonyl chloride, carbamyl chloride, or isocyanate). The resulting solution was allowed to warm to RT with stirring. Examples (Compounds 373-519)

15 *General procedure for reactions of primary amine  
scaffolds with various electrophiles using scavenger  
resins:*

The following reactions were carried out in parallel, in  
sets ranging from 9 to 48, and were done in teflon-capped  
20 glass vials using a rotary shaker for agitation. To  
vials containing 5 to 10 equiv. of either Amberlyst A-21  
resin (Aldrich, prepared by washing twice each with MeOH,  
CH<sub>2</sub>Cl<sub>2</sub>, THF, and then drying in vacuo at 60°C overnight)  
or PS-DIEA resin (Argonaut Technologies, prepared as  
25 above) were added 2 mL of 16 mM solutions of the primary  
amine starting materials in anhydrous THF or anhydrous  
CH<sub>2</sub>Cl<sub>2</sub>. These resins were not employed when isocyanates

or isothiocyanates were used as electrophiles. This was followed by addition of 3 to 5 equivalents of electrophile (acid chlorides, chloroformates, carbamyl chlorides, sulfonyl chlorides, isocyanates, isothiocyanates) either neat or as solutions in anhydrous  $\text{CH}_2\text{Cl}_2$ . The resulting mixtures were shaken at RT for 18 hours. The mixtures were then diluted two-fold with  $\text{CH}_2\text{Cl}_2$  and treated with 5-10 equiv. of PS-Trisamine resin (Argonaut Technologies, prepared as above). This was followed by shaking at RT for an additional 18 hours. The resins were then removed by filtration and the filtrates concentrated to dryness under a stream of nitrogen to afford the desired compounds.

Examples (Compounds 523-543)

General procedure for reactions of amines 520, 521, and 522 with various electrophiles using scavenger resins:

5 The following reactions were carried out in parallel and were done in teflon-capped glass vials using a rotary shaker for agitation. To vials containing 130 mg of Amberlyst A-21 resin (Aldrich, prepared as in examples 373-519, not employed when methyl isocyanate was used as

10 the electrophile) were added 1 mL of 30 mM solutions of the amine starting materials in anhydrous THF. This was followed by addition of 0.15 mL (5 equiv.) of 1M solutions of electrophiles (acid chlorides, alkyl chloroformates, *N,N*-dimethylcarbamyl chloride, methanesulfonyl chloride, methyl isocyanate) in anhydrous

15  $\text{CH}_2\text{Cl}_2$ . After the resulting mixtures were shaken at RT for 18 hours, they were diluted with  $\text{CH}_2\text{Cl}_2$  (3x), treated with 125 mg of PS-Trisamine resin (3.75 mmol/g, Argonaut Technologies, prepared as in examples 373-519, not

20 employed when methyl isocyanate was used as the electrophile) and shaken for an additional 18 hours. The resins were removed by filtration and the filtrates evaporated under a stream on nitrogen to afford the desired compounds.

Examples (Compounds 560-575)

5 Procedure for reactions of compounds 556-559 with various amines using P-TBD resin to remove phenol by-product:  
The following reactions were carried out in parallel and were done in teflon-capped sealed tubes equipped with magnetic stirrers. Solutions of 0.026 mmol of starting  
10 materials 556, 557, 558, and 559 in 3 mL of 1:1 THF/*i*-PrOH were treated with excess (40 equiv.) amine. Ammonia and  $MeNH_2$  were added as 2 M solutions in MeOH and EtOH respectively;  $Me_2NH$  was added as a 2M solution in THF; and *n*- $PrNH_2$  was added neat. The vessels were capped and  
15 solutions heated to 80°C with stirring. After 3 hours the vessels were cooled to RT and examined by tlc which indicated all reactions to be complete. The solutions were cooled to RT and evaporated under a stream of nitrogen. The resulting residues were dissolved in 3 mL  
20 of  $CH_2Cl_2$  and the solutions treated with 100 mg of polymer bound 1,3,4,6,7,8-hexahydro-2H-pyrimido [1,2-*a*]pyrimidine (P-TBD resin, 2.6 mmol/g, Aldrich). The mixtures were shaken on a rotary shaker for 3 hours, filtered to remove the resin, and the filtrates  
25 evaporated under a stream of nitrogen to afford the desired products.

#### Examples (Compounds 579-604)

Procedure for reactions of compounds 576-578 with various amines using P-TBD resin to remove 4-nitrophenol by-product:

- 5 The following reactions were carried out in parallel and were done in teflon-capped vials using a rotary shaker for agitation. Solutions of 0.025 mmol of starting materials 576, 577, and 578 in 1 mL of anhydrous THF were
- 10 treated with 10 equiv. of amine. Ammonia was added as a 2M solution in MeOH; ethylamine and dimethylamine were added as 2M solutions in THF; and the remaining amines were added neat. The solutions were shaken briefly and then allowed to stand at RT. After 2 hours tlc indicated
- 15 all reactions to be complete. The solutions were evaporated under a stream on nitrogen. The residues were dissolved in 4 mL of CH<sub>2</sub>Cl<sub>2</sub> and the solutions treated with 100 mg of polymer bound 1,3,4,6,7,8-hexahydro-2H-pyrimido [1,2-a]pyrimidine (P-TBD resin, 2.6 mmol/g, Aldrich).
- 20 The mixtures were shaken for 3 hours, filtered to remove the resin, and the filtrates evaporated under a stream of nitrogen to afford the desired products.

materials 576, 577, and 578 in 1 mL of anhydrous DMF (THF was used for examples 608, 612, and 616) were treated with 0.13 mL of *N,N*-diisopropylethylamine (omitted for examples 608, 612, and 616) followed by 15 equiv. of  
 5 amine (hydroxylamine hydrochloride, methoxylamine hydrochloride, *N,O*-dimethylhydroxylamine hydrochloride, or ethanolamine). The resulting solutions were shaken at RT. After 18 hours the solutions were diluted with 5 mL of CH<sub>2</sub>Cl<sub>2</sub>, washed with 10% aqueous citric acid (3x), 0.5N  
 10 aqueous NaOH (2x), aqueous brine (1x), and then dried over MgSO<sub>4</sub>. The drying agent was removed by filtration and the filtrates evaporated under a stream of nitrogen. Products 605, 607, 609, 611, 613, and 615 were purified by preparative tlc (2 mm silica gel plate, 98:2  
 15 CH<sub>2</sub>Cl<sub>2</sub>/MeOH). The remaining products were found to be sufficiently pure for biological evaluation.

#### EXAMPLE

##### Anti-Viral Activity

10           We measured the enzyme inhibition constants of the compounds listed in Table I against HIV-1 protease using the methods of: B. Maschera et al., "Human Immunodeficiency Virus: Mutations in the Viral Protease that Confer Resistance to Saquinavir Increase the  
15   Dissociation Rate Constant for the Protease-Saquinavir Complex", J. Biol. Chem., 271, pp. 33231-33235 (1996); and M. V. Toth et al., Int. J. Peptide Protein Res. 36, pp. 544-550. (1990)

##### Antiviral activity assay in MT4 cells

20           Antiviral HIV activity and compound-induced cytotoxicity were measured in parallel by means of a propidium iodide based procedure in the human T-cell lymphotropic virus transformed cell line MT4. Aliquots of the test compounds were serially diluted in medium  
25   (RPMI 1640, 10% fetal calf serum (FCS), and gentamycin) in 96-well plates (Costar 3598) using a Cetus Pro/Pette. Exponentially growing MT4 cells were harvested and centrifuged at 1000 rpm for 10 min in a Jouan centrifuge (model CR 4 12). Cell pellets were resuspended in fresh  
30   medium (RPMI 1640, 20% FCS, 20% IL-2, and gentamycin) to a density of  $5 \times 10^5$  cells/ml. Cell aliquots were infected by the addition of HIV-1 (strain IIIB) diluted

to give a viral multiplicity of infection of 100 x TCID<sub>50</sub>. A similar cell aliquot was diluted with medium to provide a mock-infected control. Cell infection was allowed to proceed for 1 hr at 37° in a tissue culture incubator with humidified 5% CO<sub>2</sub> atmosphere. After the 1 hr incubation the virus/cell suspensions were diluted 6-fold with fresh medium, and 125 µl of the cell suspension was added to each well of the plate containing pre-diluted compound. Plates were then placed in a tissue culture incubator with humidified 5% CO<sub>2</sub> for 5 days. At the end of the incubation period, 27 µl of 5% Nonidet-40 was added to each well of the incubation plate. After thorough mixing with a Costar multitip pipetter, 60 µl of the mixture was transferred to filter-bottomed 96-well plates. The plates were analyzed in an automated assay instrument (Screen Machine, Idexx Laboratories). The assay makes use of a propidium iodide dye to estimate the DNA content of each well.
